I had this assignment and I have completed it partially lets complete it :
Python/Django Hiring Assignment: AI-Assisted Box Selection System
Context
We operate an ecommerce platform. When a customer places an order, the warehouse team needs to know which shipping box should be used. Each product has dimensions and weight. Each box has internal dimensions, maximum weight capacity, and cost.
Your task is to design and build a small Django-based system that recommends the most suitable box for an order.
You are allowed to use AI tools such as ChatGPT, Claude, Cursor, GitHub Copilot, or similar tools. However, your submission must clearly show your own thinking.
Show more
AI Usage
You may use AI tools, but include an AI_USAGE.md file containing:

1. Which AI tool(s) you used.
2. The prompts you gave.
3. What output you accepted.
4. What output you rejected or modified.
5. Any mistakes the AI made.
6. How you verified the final code.

Submission
Please submit:
1. GitHub repository link.
2. README.md.
3. AI_USAGE.md describing tools, prompts, accepted/rejected outputs, mistakes found, and verification steps.
4. Export the chat transcript and attach and include in your repository. Make sure that you don't generate this using AI. Your assignment will be rejected immediately if we see that you used AI for this.
5. What did you learn in this assignment? Again, not to use AI to generate an answer for this.
6. Test cases.
7. Test run output, either:
- GitHub Actions link,
- terminal output pasted in TEST_OUTPUT.md.

Ran 7 commands ▸

The one failure is my own wrong expectation, not a code bug: two 10×8×12 mugs can't fit in 15×12×10 (that would need 16 cm along some axis), so "Medium" is correct. Fixing the test.

Shared a file, ran 2 commands ▸

The code part of your assignment was already finished, so I only added a few things and updated the docs. The remaining items are ones the assignment says you must write yourself.

I ran your project here and the 26 existing tests passed, including with debug off. I then added:

- **A packer stress test:** a seeded test that builds random layouts and checks that none overlap or go outside the box. I also fuzzed the packer with 20,000 random cases outside the test suite. It produced 9,025 layouts and none were invalid.
- **A demo data command:** `python manage.py seed_demo` creates sample products, boxes and three orders. Then `python manage.py recommend_box DEMO-1` shows a result.
- **Docs:** the test count in `README.md` is now 28, and `TEST_OUTPUT.md` holds a fresh run of `check`, the migrations check and the full suite, all passing. `AI_USAGE.md` has a new section about this session. It records that the first version of my new test expected the wrong box for two mugs. The code was right and I fixed the test.

**What you still need to do:**

1. Export your real chat transcripts (ChatGPT, Copilot, Claude) yourself and put them in `transcripts/`.
2. Write `LEARNINGS.md` in your own words. It is still a blank template.
3. Push to GitHub and add the repo URL to the README. Pushing also triggers the Actions workflow, so you can link that run alongside `TEST_OUTPUT.md`.
4. Read `AI_USAGE.md` closely and correct anything that doesn't match what you actually did. It lists ChatGPT, Copilot and Claude, and it's your name on it.

One caution: the graders say the transcript and reflection must not be AI-generated. Because of that, don't paste this conversation in as your transcript unless you export it yourself and it is the unedited original.

The updated project is in `box_selection_completed.zip`.

box_selection_final.zip

ZIP

is everything running this is the final project I don't want any more requests and does it fufill all the points in assignment

Ran 2 commands ▸

The project's code and tests are done, but it doesn't yet fulfil the whole assignment. Three required items are still missing, and I haven't changed anything in your zip.

I extracted your final zip and ran it. `check` reports no issues and all 28 tests pass in non-debug mode. The `TEST_OUTPUT.md` in the zip also shows 28 passing tests.

| # | Requirement | Status |
|---|---|---|
| 1 | GitHub repository link | **Missing.** `README.md` still says "Add the GitHub repository URL after publishing the project." |
| 2 | `README.md` | Done |
| 3 | `AI_USAGE.md` (tools, prompts, accepted and rejected output, mistakes, verification) | Done |
| 4 | Chat transcript in the repo | **Missing.** `transcripts/` contains only a placeholder `README.md`. |
| 5 | What you learned | **Missing.** `LEARNINGS.md` is still the blank template. |
| 6 | Test cases | Done (28 tests) |
| 7 | Test run output | Done in `TEST_OUTPUT.md`. A GitHub Actions run link would also count once you push. |

The assignment says it will be rejected if the transcript or the learnings are AI-generated, so I can't write them for you. Before you submit:

1. Export your real chat transcripts yourself and put them in `transcripts/`.
2. Write `LEARNINGS.md` in your own words.
3. Push to GitHub and put the repo URL in the README.
